Abstract

“Science and Technology in Support of
Sustainable Development and Economies”*

Many nations, both in the developed and in “big emerging markets” (BEM), now recognize the critical nature of the balance between their sustainable development and the environment, both regionally and globally. Governments have argued that science and technology applied to the issues of sustainability can provide front-end solutions for formulating a strategic plan for sustainable development in emerging markets and sustainable economies in developed nations. Thus challenged, LLNL scientists are beginning to identify what science and technologies they can apply to this area. Dr. Fluss will discuss some of LLNL’s possible contributions to this initiative with particular reference to the Asia-Pacific region.
